Amber 2021 - David A. Case 2021-06-13
Amber is the collective name for a suite of programs that allow users to carry out molecular dynamics simulations, particularly on biomolecules. None of the individual programs carries this name, but the various parts work reasonably well together, and provide a powerful framework for many common calculations. The term Amber is also used to refer to the empirical force fields that are implemented here. It should be recognized, however, that the code and force field are separate: several other computer packages have implemented the Amber force fields, and other force fields can be implemented with the Amber programs. Further, the force fields are in the public domain, whereas the codes are distributed under a license agreement. The Amber software suite is divided into two parts: AmberTools21, a collection of freely available programs mostly under the GPL license, and Amber20, which is centered around the pmemd simulation program, and which continues to be licensed as before, under a more restrictive license. Amber20 represents a significant change from the most recent previous version, Amber18. (We have moved to numbering Amber releases by the last two digits of the calendar year, so there are no odd-numbered versions.) Please see https://ambermd.org for an overview of the most important changes. AmberTools is a set of programs for biomolecular simulation and analysis. They are designed to work well with each other, and with the "regular" Amber suite of programs. You can perform many simulation tasks with AmberTools, and you can do more extensive simulations with the combination of AmberTools and Amber itself. Most components of AmberTools are released under the GNU General Public License (GPL). A few components are in the public domain or have other open-source licenses. See the README file for more information.

The Condition, Improvement and Town Planning of the City of Calcutta and Contiguous Areas - E. P. Richards 2014-08-21
By 1900 the British had undertaken various types of urban planning in their colonial territories, but the early twentieth century brought new ideas and the birth of the modern planning movement. In India these new planning ideas inspired several specialized reports after 1900, most of which drew explicitly on British, or occasionally German, ideas. The most complete of these studies was the Richards Report on Calcutta, prepared for the Calcutta Improvement Trust and published in 1914. Its major concerns included the building and widening of roads, slum clearance and improvement, legislation, and suburban planning. As background, it included written and visual documentation of living conditions, through charts, photographs, and maps. Richards emphasized that conditions in Calcutta differed greatly from those in urban Britain, and made some allowance in that regard. In general, however, his report exemplifies the attempt by British planners, along with Indian elites, to impose their vision on colonial cities. Richards' report was well-received by leading British planners of the day. A notice in Garden Cities and Town Planning claimed that it was "the most

complete report on town conditions and possibilities which has yet been issued". While the immediate impact of the report in Calcutta is moot - Richards was highly critical of the past practices of local officials, and his views were unpopular with his superiors - the Richards Reports remains a crucial insight into both the development of modern town planning and the colonial period in India.
