The Red Blood Cell - Douglas Surgenor
2012-12-02

The Red Blood Cell, Second Edition, Volume I provides information pertinent to red blood cells, which is the most intensely studied human tissue. This book reviews the basic biomedical knowledge about the circulating, red blood cells. Organized into 13 chapters, this edition starts with an overview of the discovery of red blood cells, which results in the growth of knowledge

in the areas of clinical disease and therapeutic efforts. This book then discusses the significant functions of the red blood cells, which exist basically to transport the respiratory gases. Other chapters examine the red blood cell's capacity for protein synthesis and its ability to diversify its function. This book discusses as well the progress in the structural analysis of lipids. The final chapter deals with the capacity to store red blood cells frozen for long periods with high yield of viable physiological functional cells after post-thaw processing. Scientists, physicians, teachers, researchers, and students will find this book extremely useful.

Red Blood Cell Aging - Antonio De Flora

2013-03-08

The mammalian erythrocyte is a very suitable

model for the study of aging at the cellular and molecular level. It is not only a matter of apparent simplicity in terms of biochemistry, biophysics and physiology but more likely this cell offers a great possibility for elucidating some basic problems in the process of aging. In fact, nowadays, it is possible to follow individual cells all along their life span in circulation, it is possible to obtain these cells when young, middle aged or old and it is possible to obtain cells from individuals of defined ages and transfuse them into compatible recipients to investigate the role of the environment where the cell lives, and finally it is possible to easily manipulate the red cell content in terms of enzymatic activities and/or metabolic properties to investigate the possible effect of these manipulations on cell survival. This book, *Red Blood Cell Aging*, is based on a symposium held in Urbino, Italy, at the end of 1990 and examines the impact of age on the membrane, metabolism, structural and enzymatic proteins of mammalian

erythrocytes. The various contributions to this symposium not only described those processes of aging which affect the cell but also provided a nearly complete picture of the event{s} and mechanism{s} that every day permits to recognize among 25 trillion circulating red cells {in an average adult} that 1 percent that have reached the end of their 120 day life span in circulation.

Regulation of Tissue Oxygenation, Second Edition - Roland N. Pittman 2016-08-18

This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen

from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or PO₂ on the cell surface falls to a critical level of about 4-5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the

mitochondria at or above the critical PO₂. In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.
